

Lecture **6**

Convolution

What you will learn in Lecture 6

I. The Fourier Transform: Operational Properties

II. Convolution

6.1 The Fourier Transform:

Operational Properties

6.1 The Fourier Transform: Operational Properties

FOURIER TRANSFORM

$$(1) \quad \hat{f}(\omega) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{-i\omega x} dx \quad (-\infty < \omega < \infty)$$

INVERSE FOURIER TRANSFORM

$$(2) \quad f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \hat{f}(\omega) e^{i\omega x} d\omega \quad (-\infty < x < \infty)$$

6.1 The Fourier Transform: Operational Properties

Putting $\omega = 0$ in (1), we find that

$$\hat{f}(0) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) dx$$

Thus the value of the Fourier transform at $\omega = 0$ is equal to the signed area between the graph of $f(x)$ and the x -axis, multiplied by a factor of $\frac{1}{\sqrt{2\pi}}$

6.1 The Fourier Transform: Operational Properties

EXAMPLE 1 A Fourier transform

(a) Find the Fourier transform of the function in Figure 1, given by

$$f(x) = \begin{cases} 1 & \text{if } |x| < a \\ 0 & \text{if } |x| > a \end{cases}$$

What is $\hat{f}(0)$?

(b) Express f as an inverse Fourier transform.

Solution

Tips:

- Use (1) for $\hat{f}(\omega)$
- Introduce L'Hôpital's rule $\lim_{x \rightarrow c} \frac{f(x)}{g(x)} = \lim_{x \rightarrow c} \frac{f'(x)}{g'(x)}$.
- Discuss $\omega = 0$

Find the complete solution in page 399-400 of the textbook.

Figure 2 Graph of \hat{f}

6.1 The Fourier Transform: Operational Properties

Fourier Transform Symbols

$\mathcal{F}(f)(\omega)$ denotes Fourier Transform of f

$\mathcal{F}^{-1}(f)(x)$ denotes Inverse Fourier Transform of f

Other symbols: $FT(f)$, $IFT(f)$

Operational Properties

We shall investigate the behavior of the Fourier transform in connection with the common operations on functions: **linear combination, translation and convolution etc.**

6.1 The Fourier Transform: Operational Properties

Operational Properties

THEOREM 1 LINEARITY

The Fourier transform is a linear operation; that is, for any integrable functions f and g and any real numbers a and b ,

$$\mathcal{F}(af + bg) = a\mathcal{F}(f) + b\mathcal{F}(g)$$

Proof

$$\begin{aligned}\mathcal{F}[af(x) + bg(x)] &= \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} [af(x) + bg(x)]e^{-i\omega x} dx \\ &= a \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x)e^{-i\omega x} dx + b \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} g(x)e^{-i\omega x} dx \\ &= a\mathcal{F}[f(x)] + b\mathcal{F}[g(x)]\end{aligned}$$

6.1 The Fourier Transform: Operational Properties

Operational Properties

THEOREM 2 Fourier Transforms of Derivatives

(i) Suppose $f(x)$ is piecewise smooth, $f(x)$ and $f'(x)$ are integrable, and $f(x) \rightarrow 0$ as $|x| \rightarrow \infty$, then

$$\mathcal{F}(f') = i\omega\mathcal{F}(f)$$

(ii) If in addition $f''(x)$ is integrable, and $f'(x)$ is piecewise smooth and tend to 0 as $|x| \rightarrow \infty$, then

$$\mathcal{F}(f'') = i\omega\mathcal{F}(f') = -\omega^2\mathcal{F}(f)$$

(iii) In general, if f and $f^{(k)}(x)$ ($k = 1, 2, \dots, n - 1$) are piecewise smooth and tend to 0 as $|x| \rightarrow \infty$, and f and its derivatives of order up to n are integrable, then

$$\mathcal{F}(f^{(n)}) = (i\omega)^n\mathcal{F}(f)$$

Proof

Find the complete proof in page 402 of the textbook.

6.1 The Fourier Transform: Operational Properties

Appendix B. Table of Fourier Transform (Page 1069 of the textbook)

$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \hat{f}(\omega) e^{ix\omega} d\omega$		$\hat{f}(\omega) = \mathcal{F}(f)(\omega) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{-i\omega x} dx$
1.	$\begin{cases} 1 & \text{if } x < a \\ 0 & \text{if } x > a \end{cases}$	$\sqrt{\frac{2}{\pi}} \frac{\sin a\omega}{\omega}$
2.	$\begin{cases} 1 & \text{if } a < x < b \\ 0 & \text{otherwise} \end{cases}$	$\frac{i (e^{-ib\omega} - e^{ia\omega})}{\sqrt{2\pi}\omega}$
3.	$\begin{cases} 1 - \frac{ x }{a} & \text{if } x < a \\ 0 & \text{if } x > a \end{cases} \quad a > 0$	$2 \sqrt{\frac{2}{\pi}} \frac{\sin^2(\frac{a\omega}{2})}{a\omega^2}$
4.	$\begin{cases} x & \text{if } x < a \\ 0 & \text{if } x > a \end{cases} \quad a > 0$	$i \sqrt{\frac{2}{\pi}} \frac{a\omega \cos(a\omega) - \sin(a\omega)}{\omega^2}$
5.	$\begin{cases} \sin x & \text{if } x < \pi \\ 0 & \text{if } x > \pi \end{cases}$	$i \sqrt{\frac{2}{\pi}} \frac{\sin(\pi\omega)}{\omega^2 - 1}$
⋮		

6.1 The Fourier Transform: Operational Properties

THEOREM 3 Derivatives of Fourier Series

(i) Suppose $f(x)$ and $xf(x)$ are integrable; then

$$\mathcal{F}(xf(x))(\omega) = i[\hat{f}]'(\omega) = i \frac{d}{d\omega} \mathcal{F}(f)(\omega)$$

(ii) In general, if $f(x)$ and $x^n f(x)$ are integrable, then

$$\mathcal{F}(x^n f(x)) = i^n [\hat{f}]^{(n)}(\omega)$$

Proof

Find the complete proof in page 402 of the textbook.

6.2 Convolution

6.2 Convolution

Convolution of Functions

Introducing the convolution of two functions f and g by

CONVOLUTION

$$(f * g)(x) = \int_{-\infty}^{\infty} f(x - t)g(t)dt$$

← In this lecture

Convolution Theorem $\mathcal{F}[f(x) * g(x)] = \sqrt{2\pi}\mathcal{F}[f(\omega)]\mathcal{F}[g(\omega)]$

$$(f * g)(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x - t)g(t)dt$$

← In textbook

Convolution Theorem $\mathcal{F}[f(x) * g(x)] = \mathcal{F}[f(\omega)]\mathcal{F}[g(\omega)]$

6.2 Convolution

$$(f * g)(x) = \int_{-\infty}^{\infty} f(x - t)g(t)dt$$

What does **Convolution** mean?

6.2 Convolution

Case 1

$$h = (f * g)(x) = \int_{-\infty}^{\infty} f(x - t)g(t)dt$$

$$x_1 < x_2 < x_3$$

6.2 Convolution

Case 1

$$f_{x_1} * g = \int_{-\infty}^{\infty} f(x_1 - t)g(t)dt$$

$$f_{x_2} * g = \int_{-\infty}^{\infty} f(x_2 - t)g(t)dt$$

$$f_{x_3} * g = \int_{-\infty}^{\infty} f(x_3 - t)g(t)dt$$

$$h = (f * g)(x) = \int_{-\infty}^{\infty} f(x - t)g(t)dt$$

6.2 Convolution

Case 2

$$f(x) = g(x) = \begin{cases} 1 & \text{if } |x| \leq 0.5 \\ 0 & \text{otherwise} \end{cases}$$

$$h = f * g = \int_{-\infty}^{\infty} f(x-t)g(t)dt$$

6.2 Convolution

Case 2

6.2 Convolution

Case 3

one stone wave

two stones wave

Dirac Delta Function

Generalized Functions

$$f_k(t - a) = \begin{cases} \frac{1}{k} & \text{if } a \leq t \leq a + k \\ 0 & \text{otherwise} \end{cases}$$

$$I_k = \int_{-\infty}^{\infty} f_k(t - a) dt = \int_a^{a+k} \frac{1}{k} dt = 1$$

When $k \rightarrow 0$

$$\delta(t - a) = \lim_{k \rightarrow 0} f_k(t - a)$$

$$\delta(t - a) = \begin{cases} \infty & \text{if } t = a \\ 0 & \text{otherwise} \end{cases} \quad \text{and} \quad \int_{-\infty}^{\infty} \delta(t - a) dt = 1$$

When $a = 0$

$$\delta(t) = \begin{cases} \infty & \text{if } t = 0 \\ 0 & \text{otherwise} \end{cases} \quad \text{and} \quad \int_{-\infty}^{\infty} \delta(t) dt = 1$$

The function $f_k(t - a)$

Theorem 1 in Section 7.8 ($a = 0$)

$$\int_{-\infty}^{\infty} g(t) \delta(t) dt = g(0)$$

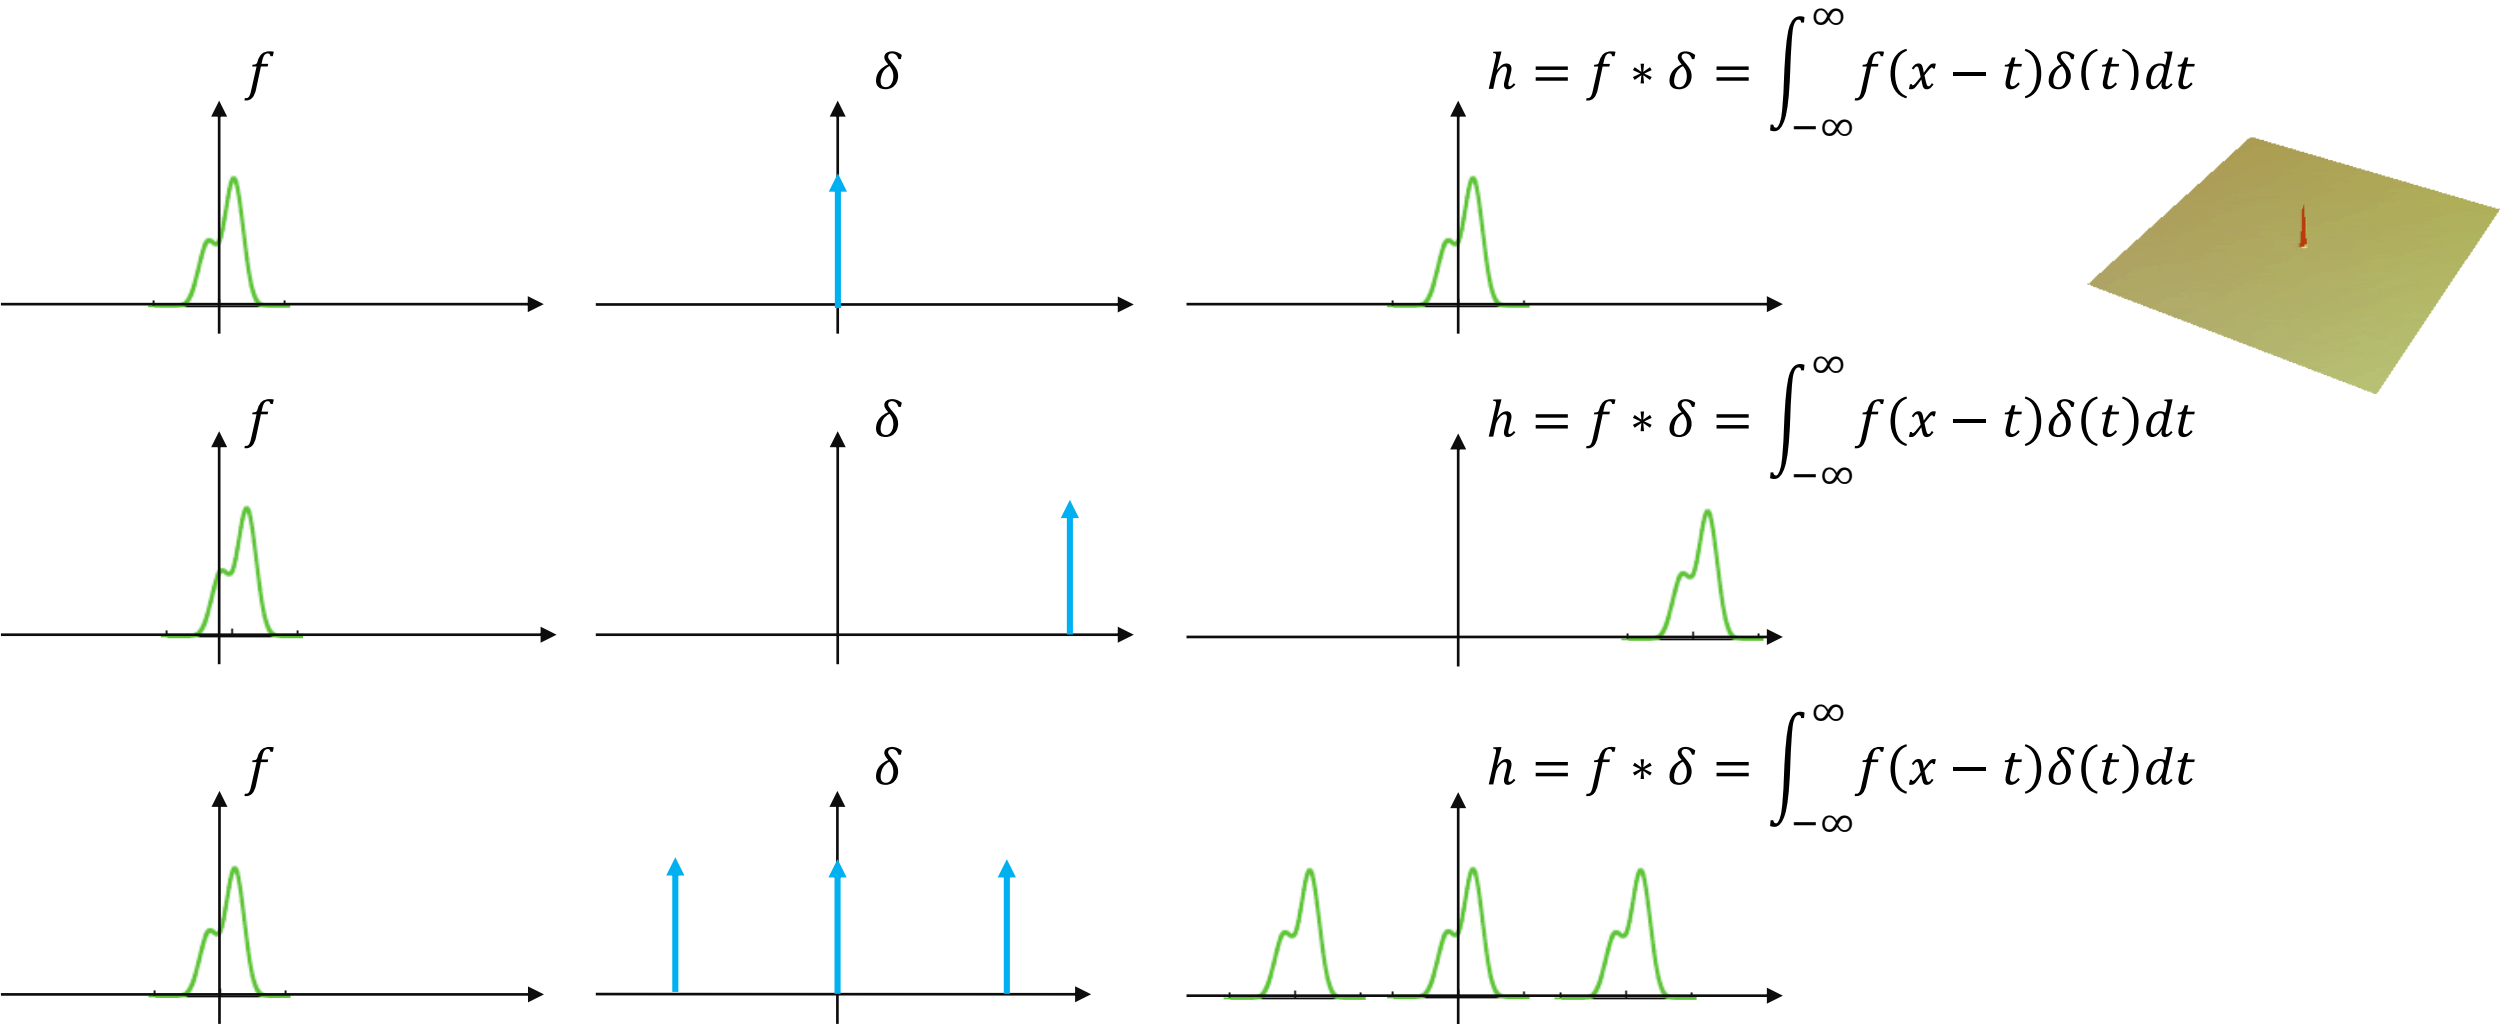

General form ($a \neq 0$)

$$\int_{-\infty}^{\infty} g(t) \delta(t - a) dt = g(a)$$

6.2 Convolution

Case 4

6.2 Convolution

EXAMPLE 3 Convolution with the cosine

Suppose that f is integrable and even ($f(-x) = f(x)$ for all x) and let $g(x) = \cos ax$.

Show that, for all real numbers a : $(f * g)(x) = \cos(ax)\hat{f}(a)$.

Solution

Tips:

- Use definition of $f * g$
- $f * g = g * f$
- f is even, then $f \sin at$ is odd
- Trigonometric identity $\cos(a - b) = \cos a \cos b + \sin a \sin b$
- $\int_{-\infty}^{\infty} -i \sin(at) dx = 0$

Find the complete solution in page 403 of the textbook.

6.2 Convolution

THEOREM 4 Fourier Transforms of Convolutions (Convolution Theorem)

Suppose that f and g are integrable; then

$$\mathcal{F}[f(x) * g(x)] = \sqrt{2\pi} \mathcal{F}[f(\omega)] \mathcal{F}[g(\omega)]$$

$$(f * g)(x) = \int_{-\infty}^{\infty} f(x-t)g(t)dt$$

In this lecture

Theorem 4 is expressed by saying that the Fourier transform takes convolutions into products.

$$\mathcal{F}[f(x) * g(x)] = \mathcal{F}[f(\omega)] \mathcal{F}[g(\omega)]$$

$$(f * g)(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x-t)g(t)dt$$

In textbook

6.2 Convolution

EXAMPLE 5 Fourier transform of a convolution

Consider the function $f(x) = 1$ if $|x| < 1$ and 0 otherwise. The graph of this function is shown in Figure 5. From Example 1, we have

$$\hat{f}(\omega) = \sqrt{\frac{2}{\pi}} \frac{\sin a\omega}{\omega}$$

Find the Fourier Transform of $f * f$.

Find $f * f$.

Solution:

Tips:

Instead of $\mathcal{F}[f(x) * f(x)]$, we compute $\mathcal{F}[f(\omega)]\mathcal{F}[f(\omega)] = \hat{f}(\omega)\hat{f}(\omega)$

Find the complete solution in page 405 of the textbook.

Figure 5 Graph of f .

6.2 Convolution

Appendix B. Table of Fourier Transform (Page 1069 of the textbook)

$f(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} \hat{f}(\omega) e^{ix\omega} d\omega$		$\hat{f}(\omega) = \mathcal{F}(f)(\omega) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} f(x) e^{-i\omega x} dx$
1.	$\begin{cases} 1 & \text{if } x < a \\ 0 & \text{if } x > a \end{cases}$	$\sqrt{\frac{2}{\pi}} \frac{\sin a\omega}{\omega}$
2.	$\begin{cases} 1 & \text{if } a < x < b \\ 0 & \text{otherwise} \end{cases}$	$\frac{i (e^{-ib\omega} - e^{ia\omega})}{\sqrt{2\pi}\omega}$
3.	$\begin{cases} 1 - \frac{ x }{a} & \text{if } x < a \\ 0 & \text{if } x > a \end{cases} \quad a > 0$	$2 \sqrt{\frac{2}{\pi}} \frac{\sin^2(\frac{a\omega}{2})}{a\omega^2}$
4.	$\begin{cases} x & \text{if } x < a \\ 0 & \text{if } x > a \end{cases} \quad a > 0$	$i \sqrt{\frac{2}{\pi}} \frac{a\omega \cos(a\omega) - \sin(a\omega)}{\omega^2}$
